

In Vitro Fertilization

With your eggs and partner's sperm

1 First Visit → 02h

Diagnosis and start of treatment

We confirm the treatment and you may even start the same day.

Your partner has to leave a sperm sample to be analyzed and tested to check whether it is viable.

A Stimulation

The ovaries are stimulated with hormones so follicles can be produced.

B Control

Through ultrasounds we can control that the size and quantity of each follicle is adequate.

15 days

The treatment is done at home

2 Second Visit → 3 to 5 days

Egg retrieval and transfer

We will let you know 2 to 3 days before the exact date.

C Egg retrieval

The egg retrieval is carried out through aspiration.

D Fertilization

We introduce a spermatozoid into the egg with a microscopic needle.

E Incubation

After 1 to 2 days in the laboratory, the fertilized eggs become pre-embryos.

F Transfer

We select 1 or 2 pre-embryos; we load them into a fine catheter and introduce them in the uterus.

¿When do we recommend this treatment?

- When there are not enough spermatozoids in the sample.
- When there is damage or obstruction in the fallopian tubes.
- After having carried out various artificial insemination attempts without success.

In less than
1 month
you can be pregnant
